

**EECS 118**  
**Knowledge Engineering and Software Engineering**  
**Fall 2018**

**Term Project**  
**Option II: A Geometry Problem Solver**  
**Project Supplement**  
**Problem Set P**

You are required to create a separate solver for each one of the following problems. Please use Python 3.5 or above as your programming language for the solver program.

**Assigned Problems:**

1. A triangle and a circle have two intersection points:  
The two intersection points are on the same side of the triangle.

2. A triangle and a circle have three intersection points:  
Two intersections are on one side of the triangle, the third intersection is on another side.

3. Two triangles have an overlapped side:

You are encouraged to draw your own diagrams according to the description. The diagrams above are only for your reference, you need to consider all cases as long as they meet the description. Please also consider boundary cases.

### Extra Credits:

Instead of creating solvers for the above problems, design a solver that can solve any two triangle problems.
